

Patrol tent pitching - for tents with a flysheet if no flysheet just miss out the flysheet instructions
 pegs knocked in at 45 deg to the ground (everyone practise)

1. lay the ridge pole on the ground where you want the centre of the tent.
2. knock in a peg at each end of the ridge pole (for the doors)
3. walk about 2 m away from the ridge pole then 3 m right and left and knock main guy pegs about 2/3 of the way in.
4. lay the flysheet next to the ridge pole and open it
5. position the ridge pole on the centre of the flysheet
6. lay the tent on top of the flysheet next to the ridge pole and open it
7. thread the ridge pole through the loops in the tent
8. put the poles with their bases by the pegs where the ridge pole was
9. fold over the inner tent

10. put the uprights through the ridge pole and eyelet in the inner tent
11. fold over the flysheet
12. position the spacer between the tent and flysheet and the main guy dollies on the spike outside the flysheet.
13. undo the main guys.

14. lift the tent into position
15. hook the mains guys onto the pegs and tighten them so the poles are upright and by the door pegs. The tent will now stand up.

16. lace up the doors and hook the door brailings onto the door pegs.

Now pitch the inner tent. Keep the guy lines long so they lift the walls.

17. Put in the 4 corner guys, pull them out long and at 45 deg. to the tent.
18. Put in the side guys pulled out long and in line with the seams.
19. Put in the brailing pegs

20. Peg out the flysheet so it does not touch the inner tent, long guy lines.

21. Remove the main guy pegs and reposition to storm lash the tent. The guys should not touch the tent of other guys.
